

#### **OBIETTIVO**

Creare un database che contenga i dati attinenti alla zona di appartenenza relativi al livello delle valanghe.

#### DATABASE di origine formato json

Il Database da cui attingere le informazioni che servono è organizzato in questo modo.

Tutti i giorni (due volte al giorno) le tre regioni (TIROLO, ALTO ADIGE, TRENTINO) interessate che popolano il database, vengono aggiornate a seconda delle condizioni meteo, temperatura, struttura della neve.

I valori delle valanghe sono 2. Uno è sottobosco e l'altro è sopra il bosco, oltre al fatto che deve essere preso in considerazione l'altezza espressa in metri della linea di demarcazione tra sotto bosco e sopra bosco, che cambia anch'esso in base a dei parametri riferiti alle condizioni sopracitate.

I campi che devono essere presi in considerazione sono:

bulletins/n/dangerRatings/2/mainValue = 2

**Limite del bosco** bulletins/n/avalancheProblems/1/elevation/lowerBound bulletins/n/dangerRatings/1/mainValue = 1

n = gruppo di appartenenza delle zone geografiche associate per livello valanghe.

#### Spiegazione.

Le zone geografiche vengono raggruppate in bulletins a seconda del valore livello valanghe comune. Il campo bulletins/n può assumere quindi valori bulletins/1 bulletins/2 bulletins/3 etc.

Può assumere questa forma:

bulletins/2/dangerRatings/2/mainValue = 2 dove **bulletins/2/ è la zona di appartenenza** bulletins/3/dangerRatings/2/mainValue = 2

etc...

# Esempio pratico:

Zona di interesse: Brenta settentrionale

# Oggi si trova nel gruppo bulletins/1

### Campi con i valori del 09/02/2025

bulletins/3/dangerRatings/2/mainValue = 2

bulletins/3/dangerRatings/1/mainValue = 1

bulletins/3/avalancheProblems/1/elevation/lowerBound=1800

## Campi con i valori del 10/02/2025

bulletins/2/dangerRatings/2/mainValue = 2

bulletins/2/dangerRatings/1/mainValue = 1

bulletins/2/avalancheProblems/1/elevation/lowerBound=2200

Si tratta quindi di individuare la zona di interesse e verificare il contenuto dei campi sopra citati.

#### Le zone di interesse sono:

Brenta settentrionale

Brenta meridionale

Latemar

Il file il cui nome sarà VAL\_ EUREGIO, conterrà questi valori avrà la seguente struttura:

#### **BRENTA Settentrionale - Peller**
